

## 7. Picture cut

Image cutting first reads the image, and then obtains the pixel area in the array. In the following code, select the shape area X: 300-500 Y: 500-700. Note that the image size is 800\*800, so the selected area should not exceed this resolution.

Code path: muto/Samples/OpenCV/02\_OpenCV Transform/02Picture clipping.ipynb

```
import cv2
img = cv2.imread('yahboom.jpg', 1)
dst = img[500:700,300:500] #Here select the rectangular area X: 300-500 Y:
500-700
#cv2.imshow('image',dst)

#cv2.waitKey(0)
```

The following will display two compressed image comparison displays in the jupyterLab control.

```
#bgr8 to jpeg format
import enum
import cv2
def bgr8_to_jpeg(value, quality=75):
    return bytes(cv2.imencode('.jpg', value)[1])
```

Below are the before and after comparison images:

```
import ipywidgets.widgets as widgets
image_widget1 = widgets.Image(format='jpg', )
image_widget2 = widgets.Image(format='jpg', )
# display the container in this cell's output
display(image_widget1)
display(image_widget2)
img1 = cv2.imread('yahboom.jpg',1)

image_widget1.value = bgr8_to_jpeg(img1) #original image
image_widget2.value = bgr8_to_jpeg(dst) #cut image
```

After the program is finished running, you can see that some parts have been cut out.
